1. Algos

1.1. Binary Search

```
1 // binary search en array ordenado
2 int n, target; cin >> n >> target;
3 vector<int> a(n);
4 for (int i = 0; i < n; i++) cin >> a[i];
5
6 // encontrar primera posición >= target
7 int l = 0, r = n - 1, first_pos = n;
8 while (l <= r) {
9     int mid = (l + r) / 2;
10    if (a[mid] >= target) {
11        first_pos = mid;
12        r = mid - 1;
13    } else {
14        l = mid + 1;
15    }
16 }
17
18 // encontrar última posición <= target
19 l = 0, r = n - 1;
20 int last_pos = -1;
21 while (l <= r) {
22     int mid = (l + r) / 2;
23     if (a[mid] <= target) {
24         last_pos = mid;
25         l = mid + 1;
26     } else {
27         r = mid - 1;
28     }
29 }
30
31 // binary search en función monótona
32 function<bool(int)> check = [&](int x) {
33     return true; // condición
34 };
35 l = 0, r = 1e9;
36 int ans = -1;
37 while (l <= r) {
38     int mid = (l + r) / 2;
39     if (check(mid)) {
40         ans = mid;
41         l = mid + 1; // o r = mid - 1 dependiendo del problema
42     } else {
43         r = mid - 1; // o l = mid + 1
44     }
45 }
```

1.2. Fast Io

26 }
27 // count = número de subarrays con suma <= target

```

2. Bit Manipulation

Técnicas para manipular bits individuales y operaciones a nivel de bit. Incluye macros útiles para competencias de programación.

2.1. Bits

Macros esenciales para manipulación de bits: verificar potencias de 2, establecer/limpiar bits, contar bits, y operaciones con LSB/MSB.

```

1 using ull = unsigned long long;
2 const ull UNSIGNED_LL_MAX = 18'446'744'073'709'551'615;

41 for (int mask = 0; mask < (1 << N); mask++)
42
43 // Recorrer subconjuntos de un superconjunto (menos el vacío)
44 int b = 0b1011; // Representación binaria de un decimal en int
45 for (int i = b; i; i = (i - 1) & b) {
46     cout << bitset<4>(i) << "\n";
47 }
48
49 void printBin(ll x) {
50     // 63 -> unsigned ll, 62 -> ll, 31 -> unsigned int, 30 -> int
51     for (ll i = 63; i >= 0; i--)
52         cout << ((x >> i) & 1);
53     cout << '\n';
54 }

```

3. Combinatory

3.1. Combi Brute Sin Mod

```

1 // nCk brute force sin MOD n <= 20
2 long long nCk_bruteforce(long long n, long long k) {
3     if (k < 0 || k > n) return 0;
4     long long res = 1;
5     for (long long i = 1; i <= k; i++) {
6         res = res * (n - i + 1) / i; // aquí la división es exacta
7     }
8     return res;
9 }
10
11 // nPk brute force sin MOD n <= 20
12 long long nPk_bruteforce(long long n, long long k) {
13     if (k < 0 || k > n) return 0;
14     long long res = 1;
15     for (long long i = 0; i < k; i++) {
16         res *= (n - i);
17     }
18     return res;
19 }

```

3.2. Combinatory

OJO: Es necesario usar binpow con MOD primo

```

1 // Devuelve el inverso modular de a mod MOD
2 // Usa el Teorema Pequeño de Fermat: a^(MOD-2) === a^(-1) (mod MOD)
3 // (válido solo si MOD es primo)
4 ll inv(ll a, ll p = MOD) {
5     return binpow(a, p - 2, p);
6 }
7
8 // Factoriales e inversos factoriales precomputados
9 // fact[n] = n! mod MOD
10 // invf[n] = (n!)^(-1) mod MOD
11 // Precomputa en O(n)
12 vector<ll> fact(MAXN + 1), invf(MAXN + 1);
13

```

```

14 void precompute_factorials() {
15     fact[0] = 1;
16     for (int i = 1; i <= MAXN; i++) {
17         fact[i] = fact[i - 1] * i % MOD;
18     }
19     invf[MAXN] = inv(fact[MAXN]);
20     for (int i = MAXN; i > 0; i--) {
21         invf[i - 1] = invf[i] * i % MOD;
22     }
23 }
24
25 // Combinatoria de n en k: nCk(n, k) para n <= 10^6
26 // "n choose k" = n! / (k! * (n-k)!) mod MOD
27 // Retorna 0 si k > n
28 ll nCk(ll n, ll k) {
29     if (k < 0 || k > n) return 0;
30     return fact[n] * invf[k] % MOD * invf[n - k] % MOD;
31 }
32
33 // Permutación de n en k: nPk(n, k) para n <= 10^6
34 // Calcula permutaciones: "n permute k" = n! / (n-k)! mod MOD
35 // Retorna 0 si k > n
36 ll nPk(ll n, ll k) {
37     if (k < 0 || k > n) return 0;
38     return fact[n] * invf[n - k] % MOD;
39 }

```

4. Data Structures

4.1. Fenwick Tree

```

1 struct FenwickTree {
2     vector<long long> tree;
3     int n;
4
5     FenwickTree(int size) : n(size + 1) {
6         tree.assign(n, 0);
7     }
8
9     void update(int idx, long long delta) {
10         for (idx++; idx < n; idx += idx & -idx) {
11             tree[idx] += delta;
12         }
13     }
14
15     long long query(int idx) {
16         long long sum = 0;
17         for (idx++; idx > 0; idx -= idx & -idx) {
18             sum += tree[idx];
19         }
20         return sum;
21     }
22
23     long long range_query(int l, int r) {
24         return query(r) - query(l - 1);
25     }
26 };
27

```

```

28 // uso:
29 // int n; cin >> n;
30 // FenwickTree ft(n);
31 // for (int i = 0; i < n; i++) {
32 //     long long x; cin >> x;
33 //     ft.update(i, x);
34 // }
35 // ft.update(idx, delta); // actualizar elemento en idx
36 // long long sum = ft.range_query(l, r); // suma en rango [l, r]

```

4.2. Find Two Numbers

```

1 // "find two number where the sum is x, and gcd(a, b) > 1" b
2 auto find = [&](ll x){
3     for(int d = 2; d <= x / 2; d++){
4         if(x % d == 0){
5             ll m = 1, n = (x / d) - 1;
6             ll a = d * m, b = d * n;
7             if(__gcd(a, b) > 1){
8                 cout<< a << ' ' << b;
9                 ps();
10                return;
11            }
12        }
13    }
14 };

```

6  for (int i = 1; i <= n; i++) {
7      for (int j = 1; j <= m; j++) {
8          if (s1[i - 1] == s2[j - 1]) {
9              dp[i][j] = dp[i - 1][j - 1];
10         } else {
11             dp[i][j] = 1 + min({dp[i - 1][j], dp[i][j - 1], dp[i - 1][j - 1]});
12         }
13     }
14 }
15 // dp[n][m] = edit distance (mínimo número de operaciones: insertar, eliminar, reemplazar)
16 // para convertir s1 en s2

```

5.4. Knapsack

```

1  int n, capacity; cin >> n >> capacity;
2  vector<int> weight(n), value(n);
3  for (int i = 0; i < n; i++) {
4      cin >> weight[i] >> value[i];
5  }
6  vector<long long> dp(capacity + 1, 0);
7  for (int i = 0; i < n; i++) {
8      for (int w = capacity; w >= weight[i]; w--) {
9          dp[w] = max(dp[w], dp[w - weight[i]] + value[i]);
10     }
11 }
12 // dp[capacity] = valor máximo que se puede obtener con capacidad máxima
13 // para version con items ilimitados, cambiar el loop: for (int w = weight[i]; w <= capacity; w++)

```

5.5. Lcs

```

1  string s1, s2; cin >> s1 >> s2;
2  int n = s1.size(), m = s2.size();
3  vector<vector<int>> dp(n + 1, vector<int>(m + 1, 0));
4  for (int i = 1; i <= n; i++) {
5      for (int j = 1; j <= m; j++) {

```

```

6     if (s1[i - 1] == s2[j - 1]) {
7         dp[i][j] = dp[i - 1][j - 1] + 1;
8     } else {
9         dp[i][j] = max(dp[i - 1][j], dp[i][j - 1]);
10    }
11 }
12 }
13 // dp[n][m] = longitud de LCS (Longest Common Subsequence)
14
15 string reconstruct_lcs() {
16     string lcs = "";
17     int i = n, j = m;
18     while (i > 0 && j > 0) {
19         if (s1[i - 1] == s2[j - 1]) {
20             lcs += s1[i - 1];
21             i--, j--;
22         } else if (dp[i - 1][j] > dp[i][j - 1]) {
23             i--;
24         } else {
25             j--;
26         }
27     }
28     reverse(lcs.begin(), lcs.end());
29     return lcs;
30 }
31 // lcs = string de la LCS

```

6. Geometry

6.1. 2D Geometry

Cookbook Geometría 2D - Operaciones con Puntos, Vectores, Líneas y Polígonos

PROBLEMAS TÍPICOS Y SUS SOLUCIONES

- ¿Un segmento toca un rectángulo?

Construir 4 lados del rectángulo como `Line`, usar `segIntersect(seg, lado_i)` para $i = 1, 4$, y verificar con `between`/extremos dentro para cubrir el caso “segmento completamente dentro”.

Funciones clave: `segIntersect`, `between`, `Point/Line`.

- ¿Dos segmentos se cruzan?

Usar `segIntersect(l1, l2)` si contar colineales y tocar endpoints, o `segStrictlyIntersect(l1, l2)` si solo quieres cruce estricto.

- Distancia mínima entre dos segmentos

Real $d = \text{segDist}(l1, l2)$; Si $d = 0$ entonces se tocan o cruzan.

- Distancia mínima de un punto a un segmento

Real $d = \text{pointToSegDist}(p, \text{seg})$;

- Distancia mínima de un punto a una recta infinita

Real $d = \text{pointToLineDist}(p, \text{line})$;

- ¿Punto dentro de un polígono cualquiera?

bool $\text{inside} = \text{pointInPoly}(p, \text{poly})$;

- Área de un polígono (ordenado CCW o CW)

T $\text{twice} = \text{area}(\text{poly})$; Real $A = \text{fabsl}((\text{Real})\text{twice}) / 2.0$;

■ ¿Cuándo un triángulo es degenerado?

Un triángulo con vértices a, b, c es degenerado (área = 0) si: (1) sus puntos son colineales `sign(cross(b-a, c-a)) == 0`, o (2) con lados a, b, c , falla la desigualdad triangular estricta ($a+b > c, a+c > b, b+c > a$), i.e., $a+b=c$ (se aplana).

■ ¿Punto sobre el borde de un polígono?

Recorrer lados $[i, i+1]$, verificar si `pointOnSeg(p, Line(ai, aj))`.

■ ¿Dos rectas infinitas se cruzan? Dame el punto

Primero verificar que no sean paralelas: `sign(cross(direction(l1), direction(l2))) != 0`, luego `P<Real>inter = lineIntersection(l1, l2);`

■ Ordenar vectores/puntos por ángulo alrededor del origen

`sort(v.begin(), v.end(), polar<i64>);` o usar lambda con `up()` y `cross()`.

■ Vector normal a un segmento

`P<T>d = direction(seg); P<T>n = rotate90(d);` (normal 90° CCW) o `P<Real>nu = normal(d);` (normal unitaria).

■ Detectar si un punto está a la izquierda/derecha de un borde

`int s = side(p, a, b);` donde $s > 0$ izquierda (CCW), $s < 0$ derecha (CW), $s = 0$ colineal.

■ Clasificar orientación de un polígono

`T twice = area(poly);` Si `twice > 0` es CCW, si `twice < 0` es CW.

■ Reflexión de un punto respecto a una recta

`P<Real>pr = reflection(p, line);`

■ Proyección de un punto sobre una recta

`P<Real>proj = projection(p, line);`

■ Intersección de rayo con segmento

`rayIntersect(rayo1, rayo2)` si ambos modelados como `Line` con origen en `l.l[0]` y dirección `l.l[1]-l.l[0]`. Para rayo vs segmento, combinar con `segIntersect` o rediseñar con `side()` y `dot()`.

■ Rotar un punto/vector alrededor del origen

`P<Real>rotado = rotate(p, angulo_en_radianes);` Para 90° CCW rápido: `rotate90(p);`

■ Calcular ángulo de un vector respecto al eje X

`Real ang = angle(p);` devuelve `atan2(p.y, p.x)` en radianes.

TIPS IMPORTANTES

- Usa `Point = P<i64>` para coords enteras, evita overflow en `cross/dot`
- Usa `P<Real>` (long double) para resultados con decimales (distancias, intersecciones)
- `EPS = 1e-9` para comparaciones de flotantes
- `sign()` y `cmp()` manejan tolerancia automáticamente
- Para convex hull y polígonos, mantén puntos en sentido CCW
- Verifica casos especiales: colineales, segmentos degenerados (mismo punto)
- Al leer entrada: `Point p; cin >>p;` (operador sobrecargado)

```

1 // ===== Tipos base =====
2 // - i64: reemplazo al long long
3 // - Real: para cálculos con flotantes de más precisión (distancias, intersecciones, etc.).
4 using i64 = long long;
5 using Real = long double;
6 constexpr Real EPS = 1e-9;
7
8 // ===== sign / cmp =====
9 // - sign(x): devuelve -1, 0, 1 (según x < 0, x == 0, x > 0)
10 // - cmp(a, b): compara a y b con tolerancia (para Real).
11 //   cmp(a, b) == 0 -> a "igual" a b, cmp(a, b) < 0 -> a < b, etc.

35     }
36     return true;
37 }

```

9.4. Phi Euler

$\Phi(n)$ = contar la cantidad de numero coprimos entre 1 a n

```

1 int phi(int n) {
2     int ans = n;
3     for(int i = 2; i * i <= n; i++) {
4         if(n % i == 0) {
5             while (n % i == 0) {
6                 n /= i;
7             }
8             ans -= ans / i;
9         }
10    }
11    if(n > 1) {
12        ans -= ans / n;
13    }
14    return ans;
15 }

```

```

16
17 /** phi(n) -> complex: O(log(log(n)))
18 void phi_1_to_n(int n) {
19     vector<int> phi(n + 1);
20     for (int i = 0; i <= n; i++)
21         phi[i] = i;
22
23     for (int i = 2; i <= n; i++) {
24         if (phi[i] == i) {
25             for (int j = i; j <= n; j += i)
26                 phi[j] -= phi[j] / i;
27         }
28     }
29 }

```

9.5. Potenciación Binaria

```

1 using ll = long long;
2 const int MAXN = 1e6; // límite superior de n
3 const ll MOD = 1e9 + 7; // primo grande
4
5 // Potenciación binaria modular a^b mod p
6 ll binpow(ll a, ll b, ll m = MOD) {
7     a %= m;
8     ll res = 1;
9     while (b > 0) {
10         if (b & 1)
11             res = res * a % m;
12         a = a * a % m;
13         b >>= 1;
14     }
15     return res;
16 }

```

9.6. Sieve

```

1 // Criba de Eratostenes: Hasta N = 10^6
2 void sieve(vector<bool>& is_prime) {
3     int N = (int) is_prime.size();
4     if (!is_prime[0]) is_prime.assign(N+1, true);
5     is_prime[0] = is_prime[1] = false;
6     for (int p = 2; p * p <= N; p++) {
7         if (is_prime[p]) {
8             for (int i = p * p; i <= N; i += p) {
9                 is_prime[i] = false;
10            }
11        }
12    }
13 }

```

9.7. Sieve Bitset

```

1 // Hasta N = 10^8 aprox en 1s
2 const int MAX_V = 1e7 + 5;
3 bitset<MAX_V> composite;
4 void sieve() {
5     composite[0] = composite[1] = true;
6     for (int i = 2; i * i < MAX_V; i++) {
7         if (composite[i]) continue;

```

```
8         for (int j = i * i; j < MAX_V; j += i) {
9             composite[j] = true;
10        }
11    }
12}
13
14int main() {
15    sieve();
16    for (int i = 2; i < 100; i++) {
17        cout << i << "is primes:" << !composite[i] << '\n';
18    }
19}
```

9.8. Sum Of Divisors

```
1  /* Sum of divs
2  long long SumOfDivisors(long long num) {
3      long long total = 1;
4
5      for (int i = 2; (long long)i * i <= num; i++) {
6          if (num % i == 0) {
7              int e = 0;
8              do {
9                  e++;
10                 num /= i;
11             } while (num % i == 0);
12
13             long long sum = 0, pow = 1;
14             do {
15                 sum += pow;
16                 pow *= i;
17             } while (e-- > 0);
18             total *= sum;
19         }
20     }
21     if (num > 1) {
22         total *= (1 + num);
23     }
24     return total;
25 }
```

10. Numerical Methods

10.1. Calculating The Determinant Of A Matrix By Gauss

```
1  const double EPS = 1E-9;
2  int n;
3  vector < vector<double> > a (n, vector<double> (n));
4
5  double det = 1;
6  for (int i=0; i<n; ++i) {
7      int k = i;
8      for (int j=i+1; j<n; ++j)
9          if (abs (a[j][i]) > abs (a[k][i]))
10             k = j;
11     if (abs (a[k][i]) < EPS) {
12         det = 0;
13         break;
14     }
```

```

15     swap (a[i], a[k]);
16     if (i != k)
17         det = -det;
18     det *= a[i][i];
19     for (int j=i+1; j<n; ++j)
20         a[i][j] /= a[i][i];
21     for (int j=0; j<n; ++j)
22         if (j != i && abs (a[j][i]) > EPS)
23             for (int k=i+1; k<n; ++k)
24                 a[j][k] -= a[i][k] * a[j][i];
25 }
26
27 cout << det;

```

10.2. Gauss Method For Solving System Of Linear Equations

```

1  const double EPS = 1e-9;
2  const int INF = 2; // it doesn't actually have to be infinity or a big number
3
4  int gauss (vector < vector<double> > a, vector<double> & ans) {
5      int n = (int) a.size();
6      int m = (int) a[0].size() - 1;
7
8      vector<int> where (m, -1);
9      for (int col=0; row=0; col<m && row<n; ++col) {
10         int sel = row;
11         for (int i=row; i<n; ++i)
